Managed file transfer (MFT) is a technology platform that allows organizations to reliably exchange electronic data between systems and people in a secure way to meet compliance needs. Managed file transfer (MFT) is a technology platform that uses administrative controls, support for security protocols (like HTTPS, SFTP, FTPS), and automation capabilities to help companies securely share various types of data, including sensitive or compliance-protected data as well as high-volume data.What is MFT and how it works? MFT helps organizations send and receive files in the cloud and across their private networks, create and control workflows, automate business processes, and centralize management from a single systemWhat is MFT vs FTP? MFT offers a higher level of security than FTP by supporting secure protocols such as FTPS (FTP over SSL/TLS) and SFTP (FTP over SSH). These protocols provide additional security and encryption to protect data in transit, which helps prevent data snooping, tampering, and leakage.
