About the course Logical access control fundamentals

Logical access control course, in this course will delve into the principles and practices of controlling access to data and systems based on user credentials, permissions, and authentication mechanisms. Through a comprehensive curriculum, learners will explore various methods such as Role-Based Access Control (RBAC), Access Control Lists (ACLs), Single Sign-On (SSO), and Multi-Factor Authentication (MFA). Additionally, the course will cover access control policies, enforcement mechanisms, and identity management strategies to ensure secure and efficient access to organizational resources. Participants will gain a deep understanding of logical access control frameworks and best practices to effectively manage and protect digital assets from unauthorized access and misuse.
